

Lommerse Breeding Selection and breeding of ornamental plants

Dahlia Decoretta® Serie

The Dahlia Decoretta Series is a distinguishing plant shape, due to a compact full plant structure, formed by a strong basal branching.

Lommerse Breeding Selection and breeding of ornamental plants

Strong and distinguishing characteristics

- Distinguishing plant shape due to a compact full plant structure, formed by a strong basal branching
- Genetic compactness, requires less use of growth regulators
- Flower presentation with a large diameter and bright colours
- Strong bud development for a continuous long-flowering capacity
- Dark green leaf development
- Ratio plant structure / flower size is in balance
- Uniformity in plant shape and inflorescence, an equal first flowering in all primary colours
- Objective focussed breeding for renewal and supplementation
- Cultivation possibility 10-11-12-13 cm flower pot with an average cultivation period of 7,5 8 weeks
- Practical value as pot plant / patio plant / balcony plant and garden plant
